

TTS(Text-to-Speech)-CoisyVoice

Text-to-Speech (TTS) is a technology that converts text into natural, expressive speech using deep learning. It is widely used in customer service, voice assistants, and more. Alibaba Cloud's TTS allows customization of voice type, style, speed, and volume, and supports multiple languages and dialects.

Alibaba Cloud has implemented the application of core technologies such as intelligent trial speech recognition, meeting transcription, trial assistance, prohibited word detection, and voiceprint verification in court trial scenarios. These technologies cover judicial institutions at various levels nationwide, including municipal/district courts, procuratorates, discipline inspection commissions, prisons, and public security agencies. Notably, the coverage rates reached 60% for offline courtrooms and 96% for internet-based courtrooms.
